Assembly tolerance stack-up analysis is used for calculating the tolerance value of the overall assembly (or a gap in the assembly) from the tolerance values of the individual components. The worst case method of the stack up analysis is the simplest.

[What is Tolerance Stack-up? - sigmetrix.com](#)

Tolerance stack-up calculations represent the cumulative effect of part tolerance with respect to an assembly requirement. The idea of tolerances stacking up would refer to adding tolerances to find total part tolerance, then comparing that to the available gap or performance limits in order to see if the design will work properly. This simple comparison is also referred to as worst case
